GIT and GITHUB

Guide for beginners

GIT

Git is free and open source distributed version control system designed to handle everything from small to very large projects with speed and efficiency.

It helps you to keep track of all the changes you made in your source code by storing each change as a "version".

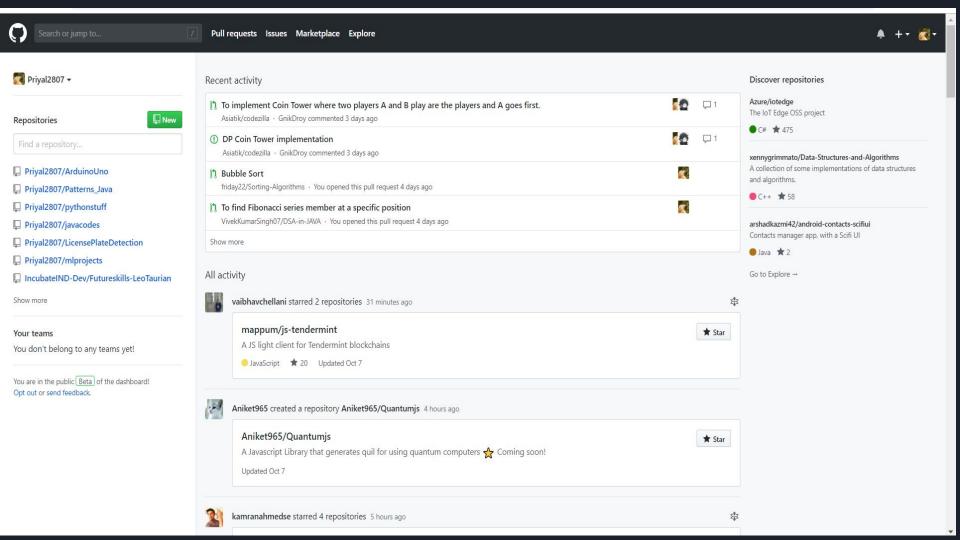

GITHUB

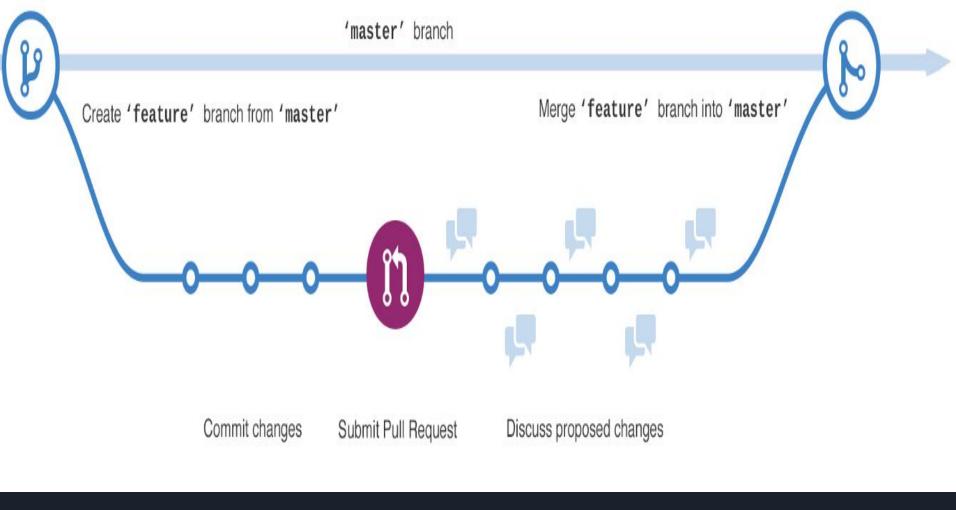

Github Inc. is a web based hosting service for version control using Git.

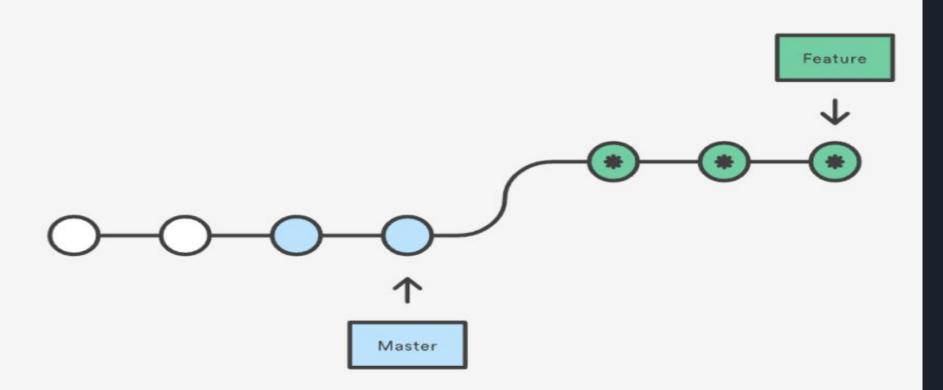

It is mostly used for computer code.

It offers all the distributed version control and source code management functionality of Git as well as adding its own features.

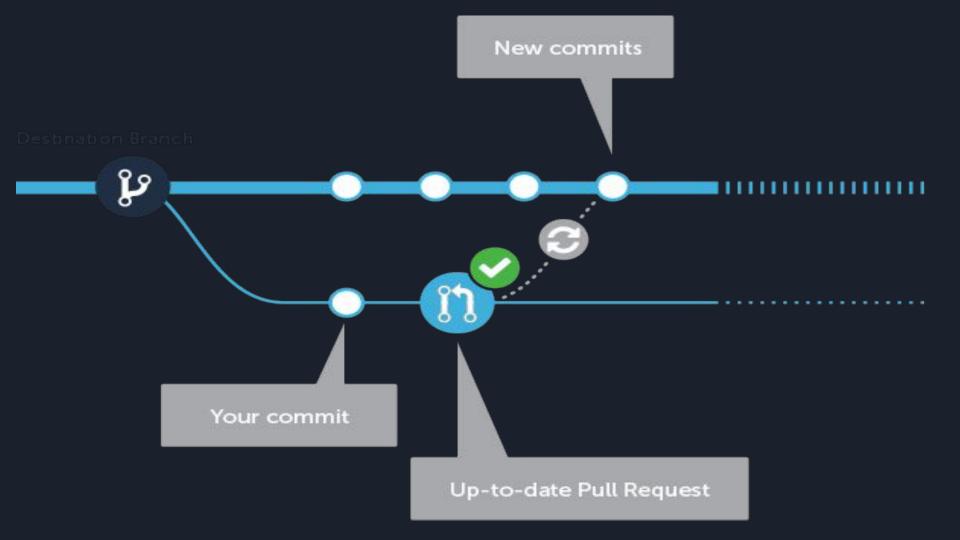

When working in Collaboration?

How Does Git Work?

Contents

→ Git Bash

→ Commands used

>>git init

Initialise the local directory as git repository

>>git add .

Add the files in your new local repository. This stages them for the first commit.

>>git commit - m "message"

repository

Commit the files that you've staged in your local

>>git remote add origin <u>remoterepository URL</u>

Sets the new remote

>>git remote -v

Verifies the new remote URL

>>git push -u origin master Push the changes in your local repository to Github
